DIGITAL FORENSICS EXAMINATION REPORT

OPERATION SIM SHIFT

Mobile Money Fraud via SIM Swap

CASE REFERENCE	HC-GH-2025-SF-0089
CASE TYPE	Mobile Money Fraud (SIM Swap)
CLASSIFICATION	CONFIDENTIAL — LAW ENFORCEMENT SENSITIVE
JURISDICTION	Republic of Ghana
DATE OF REPORT	2025-04-02
PREPARED BY	Hive Consult — Digital Forensics Division
REPORT STATUS	FINAL

*This report is prepared exclusively for the use of the requesting law enforcement authority.
Unauthorized disclosure is prohibited.*

SECTION A — CASE ADMINISTRATION

A.1 Case Identification

Field	Detail
Case Reference Number	HC-GH-2025-SF-0089
Investigation Title	Operation SIM Shift
Case Classification	Mobile Forensics — Mobile Money Fraud (SIM Swap)
Jurisdiction	Republic of Ghana
Date Submitted	2025-04-01
Date of Report	2025-04-02

A.2 Examiner Information

Field	Detail
Examining Organization	Hive Consult — Digital Forensics Division
Lead Examiner	Julian Derry
Examiner Certification	CSA/572/3GA/723-86426
Supervising Analyst	Nana Sei Anyemedu
Laboratory Reference	0089

A.3 Chain of Custody Summary

Step	Detail
Exhibit Received From	AnansePay
Date / Time Received	2025-04-01 07:30
Condition on Receipt	Device powered off, no external damage observed
Storage Location	Hive Consult Lab
Seal Intact on Receipt?	Yes
Date Examination Commenced	2026-06-15
Date Examination Completed	2026-06-15

SECTION B — EVIDENCE & DEVICE OVERVIEW

B.1 Exhibit Details

Attribute	Value
Exhibit Reference	HC-GH-2025-SF-0089-E001
Device Make & Model	Samsung Galaxy A23
IMEI	359876543210987
Android Version	13
Extraction Method	File System + Logical
Extraction Tool	Cellebrite UFED 4PC
Extraction Date	2025-04-02

B.2 Forensic Image Integrity

Attribute	Value
Image Format	E01 (Expert Witness Format)
MD5 Hash (Provided)	411b57cc86dca89d34eb5b89713788c3
MD5 Hash (Verified)	411b57cc86dca89d34eb5b89713788c3
Hash Match?	YES — Image integrity confirmed
Verification Tool	QuickHash v3.3.4
Verification Date / Time	2025-04-01 01:20

INTEGRITY FINDING: The MD5 hash of the acquired E01 image (411b57cc86dca89d34eb5b89713788c3) matches the reference value provided by the submitting authority. The forensic image is verified as an exact and unaltered copy of the original storage media. All subsequent analysis is based on this verified image.

SECTION C — SOCIAL ENGINEERING & INITIAL CONTACT

C.1 First Point of Contact

Attribute	Value
Communication Channel	WhatsApp
Unix Timestamp	1743495600
Converted Timestamp (UTC+0)	2025-04-01 08:20
Direction	Inbound — Fraudster to Victim
Fraudster Persona	AnansePay Telecom Support

C.2 Pretext Message

Verbatim Pretext Used by Fraudster:

data	timestamp
Hello, this is Ananse Telecom Support. Our records show your SIM card is faulty and will stop working today. To avoid losing your number permanently, we need to verify your identity. Please send a photo of your Ghana Card.	1743495600

"Hello, this is Ananse Telecom Support. Our records show your SIM card is faulty and will stop working today. To avoid losing your number permanently, we need to verify your identity. Please send a photo of your Ghana Card."

This message exhibits classic social engineering hallmarks: urgency ("will stop working today"), authority impersonation ("Ananse Telecom Support"), and fear of loss ("avoid losing your number permanently"). The pretext was deliberately constructed to override the victim's critical judgement.

C.3 Identity Document Disclosure

Event	Timestamp	File Location
Front of Ghana Card photographed and sent	2025-04-01 08:52	WhatsApp Images Folder / DCIM/Camera (SD Card)
Back of Ghana Card photographed and sent	2025-04-01 08:53	WhatsApp Images Folder / DCIM/Camera (SD Card)

C.4 WhatsApp Chat Screenshot

messages

tsapp.net	1	WA005	1	GhanaCard_back.jpg	1743497580	GhanaCard_back.j
tsapp.net	0	WA006	1	Perfect, thank you. We also need the 6-digit code that will be sent to your phone shortly, to confirm your identity for the SIM transfer. This is required to keep your number active.	1743497880	
tsapp.net	1	WA007	1	Ok I understand, I will send it as soon as it comes	1743498240	
tsapp.net	0	WA008	1	Thank you. We also need the 6-digit code that will be sent to your phone shortly, to confirm your identity for the SIM transfer.	1743498300	
tsapp.net	1	WA009	1	The code is 583920	1743498900	
tsapp.net	0	WA010	1	Perfect, thank you for your cooperation. Your SIM will remain active. Have a good day.	1743498960	

Figure C-1: WhatsApp Conversation — Social Engineering Exchange (08:20 to 09:16)

C.5 Ghana Card Image Evidence

Figure C-3: Recovered Ghana Card Image (Back) — DCIM/Camera, SD Card

SECTION D — SIM SWAP EXECUTION

D.1 One-Time Password (OTP) Interception

Attribute	Value
OTP Code	583920
OTP Delivered at (Unix)	1743498840000
OTP Delivered at (Converted)	2025-04-01 09:14
Victim Action	Forwarded OTP to fraudster via WhatsApp
Fraudster's Last Message to Victim	"Perfect, thank you for your cooperation. Your SIM will remain active. Have a good day" — 2025-04-01 09:16

The victim transmitted the OTP directly to the fraudster via WhatsApp at approximately 09:14. This action provided the fraudster with all credentials necessary to execute the SIM swap at the retail outlet.

D.2 SIM Swap at Retail Outlet

Attribute	Value
Swap Executed at (Network Log)	2025-04-01 09:14:05 (NETWORK_EVENT entry — device-side radio log)
Customer Notification SMS	2025-04-01 09:22 (TS: 1743499320000) — CRM notification SMS dispatched by Ananse Telecom; reflects notification pipeline lag, not execution time
Telecom Outlet	Ananse Telecom — Kaneshie, Accra
Duration Between OTP Delivery and Swap	5 seconds (OTP delivered to original SIM at 09:14:00; swap executed at 09:14:05 per network log)

D.3 Cellular Service Disruption

Attribute	Value
Last Message Received by Victim	2025-04-01 09:16 ("Your SIM will remain active. Have a good day")

First Message Sent by Victim After Gap	2025-04-01 09:58 ("Hello? My phone has no network since this morning. Is this related to the upgrade?")
Duration of Service Outage	42 minutes
Service Restored	2025-04-01 15:38:50 (support action logged) / 15:39:15 (Samsung Galaxy A23 re-registered on network)
Restoration Outlet	Ananse Telecom — Osu, Accra

FORENSIC NOTE: The 42-minute cellular service gap (09:16 to 09:58) is corroborated by WhatsApp message metadata. During this window the victim had no SMS or call capability, allowing the fraudster to operate the victim's mobile money account without risk of OTP interception by the rightful owner.

SECTION E — FINANCIAL CRIMES ANALYSIS

E.1 AnansePay Account — Pre-Fraud Balance

Attribute	Value
Account Balance Immediately Before Fraud	GH¢ 4,350.00
Data Source	AnansePay Application Database (device storage)

E.2 New Device Linkage

Attribute	Value
Device Linked to Account	Infinix Hot 30
Linkage Timestamp (Unix)	1743501300000
Linkage Timestamp (Converted)	2025-04-01 09:55
Significance	The fraudster linked a new device before initiating transfers to prevent victim from regaining access

E.3 Fraudulent Transaction Log

#	Unix Timestamp	Converted Time	Recipient	Account No.	Amount (GH¢)
1	1743500280000	2025-04-01 09:38	KWABENA MENSAH	0284281931	4,200.00
2	1743500520000	2025-04-01 09:42	KWABENA MENSAH	0284281931	150.00
TOTAL					4,350.00

E.4 Fund Laundering — Second Tier Transfer

Attribute	Value
Second Recipient	ABDUL RAHMAN
Time Since First Transfer	Approximately 27 minutes

Table transactions 6 entries Page 1 of 1 Export to CSV

Figure E-2: Second-Tier Transfer Evidence — Onward Transfer to ABDUL RAHMAN

E.5 Victim’s Post-Incident Actions

Following discovery of the fraud, the victim took the following documented steps:

- Sent messages to the fraudster via WhatsApp querying the fund drainage and service disruption.
- Took screenshots of the entire WhatsApp conversation.
- Lodged a formal complaint with Ananse Telecom with Ticket Reference: TKT-2025-118827.
- Conducted web searches indicating intent to file a police report (queries recovered from device browser history).
- Attended Osu, Accra outlet to restore SIM service at 15:40 on 2025-04-01.
- Decided to file a police report with his brother on 2025-04-02.

E.6 Browser History — Victim Intent Searches

Search Query	Inference
Ananse telecom sim swap how to report	Seeking official reporting channel
how to recover stolen Anansepay money	Investigating fund recovery options
Ananse telecom fraud hotline number	Attempting to contact telecom provider
2024 Ananspay block sim	Researching emergency SIM block procedure
police report mobile money fraud Ghana	Preparing for formal law enforcement report

Table keyword_search_t... 5 entries Page 1 of 1		
keyword_id	url_id	term
1	1	ananse telecom sim swap how to report
1	2	how to recover stolen anansepay money
1	3	ananse telecom fraud hotline number
1	4	2024 anansepay block sim
1	5	police report mobile money fraud ghana

Figure E-3: Browser History Extract — Post-Incident Search Queries

SECTION F — SYNTHESIS

F.1 Complete Event Timeline

The following timeline reconstructs the full chain of events from first contact to police report. Each entry is cited to its forensic artifact source.

Figure F-1: Fraud Network Tree — Operation SIM Shift (HC-GH-2025-SF-0089)

TIMESTAMP	EVENT	ARTIFACT SOURCE	SIGNIFICANCE
2025-04-01 08:20 (TS: 1743495600)	Fraudster initiates first contact with victim via WhatsApp, impersonating Ananse Telecom Support.	WhatsApp message database (device storage)	Establishes the social engineering vector and start of the attack chain.
2025-04-01 08:52	Victim photographs and transmits front of Ghana Card via WhatsApp.	WhatsApp Images folder / DCIM/Camera (SD Card)	Identity document exposure provides fraudster with KYC data needed for SIM swap.

2025-04-01 08:53	Victim photographs and transmits back of Ghana Card via WhatsApp.	WhatsApp Images folder / DCIM/Camera (SD Card)	Completes full Ghana Card disclosure.
2025-04-01 09:14 (TS: 1743498840000)	Telecom OTP code 583920 delivered to victim's device. Victim immediately forwards code to fraudster via WhatsApp.	SMS database; WhatsApp message database	Critical security credential surrendered enables physical SIM swap at outlet.
2025-04-01 09:16 (TS: 1743498960)	Fraudster sends final reassurance message: "Your SIM will remain active. Have a good day." This is the last message received by the victim before service loss.	WhatsApp message database	Marks the end of active social engineering; victim still unaware of fraud.
2025-04-01 09:14:05 (network log primary source)	SIM swap executed at Ananse Telecom outlet ANS-KSH-0042, Kaneshie, Accra. New ICCID (8923301098765432187) provisioned; Infinix Hot 30 registers on network 13 seconds later at 09:14:18. NOTE: 09:22 (TS: 1743499320000) in the SMS database is the CRM customer notification SMS — a lagging artefact, not the execution timestamp.	Network registration log (device / telecom records)	Technical execution complete, victim loses control of mobile identity.
2025-04-01 09:38 (TS: 1743500280000)	First fraudulent transfer: GH¢ 4,200.00 debited from victim's AnansePay wallet to KWABENA MENSAH (0284281931).	AnansePay application database	Primary financial extraction, first stage of fund drainage.
2025-04-01 09:42 (TS: 1743500520000)	Second fraudulent transfer: GH¢ 150.00 (remaining balance) debited. Account reduced to zero.	AnansePay application database	Complete account drainage, total loss GH¢ 4,350.00.
2025-04-01 09:55 (TS: 1743501300000)	New device (Infinix Hot 30) linked to victim's AnansePay account by fraudster.	AnansePay account session / device log	Consolidates fraudster's control; blocks victim from account recovery.
2025-04-01 09:58 (TS: 1743501480)	Victim sends message: "Hello? My phone has no network since this morning. Is this related to the upgrade?" — first confirmed message after cellular restoration.	WhatsApp message database	Marks end of 42-minute service outage; victim becomes aware of loss.
2025-04-01 09:58 onward	Victim sends follow-up messages to fraudster querying drained funds; takes screenshots of full chat.	WhatsApp message database	Evidence preservation action by victim.
Within 27 minutes of 09:42	GH¢ 4,350.00 onward-transferred from KWABENA MENSAH's account to ABDUL RAHMAN.	Secondary transaction records (external to device)	Fund layering second-tier mule account obscures trail.
2025-04-01 15:38:50 (support action) / 15:39:15 (device re-registered)	Victim's SIM restored at Ananse Telecom — Osu, Accra (Outlet ANS-OSU-0011). Ticket TKT-2025-118827 generated. Samsung Galaxy A23 re-registers on network at 15:39:15.	Telecom complaint record	Official complaint initiated with telecom provider.
2025-04-01 (post-15:40)	Victim conducts multiple browser searches related to SIM swap reporting, fund recovery, and police reporting procedures.	Device browser history	Demonstrates victim's distressed state and proactive steps to seek recourse.

2025-04-02	Victim files police report accompanied by his brother.	Police report / case submission	Formal criminal complaint lodged — triggers this forensic examination.
------------	--	---------------------------------	--

F.2 Fraud Stage Analysis

Based on the totality of evidence, the following five-stage fraud model is established:

Stage 1 — Reconnaissance

The fraudster identified the victim as an AnansePay user and likely obtained the victim's WhatsApp number through publicly available channels, purchased contact lists, or network harvesting. No on-device evidence of reconnaissance activity by the perpetrator was recovered; this stage occurred outside the victim's device.

Stage 2 — Social Engineering

Execution: 08:20 to 09:16 on 2025-04-01. The fraudster impersonated Ananse Telecom Support via WhatsApp, deploying urgency, authority, and fear to manipulate the victim into disclosing his Ghana Card (08:52–08:53) and OTP code 583920 (09:14). The closing reassurance message at 09:16 was designed to prevent the victim from raising an alarm before the swap was completed.

Stage 3 — Technical Execution (SIM Swap)

Execution: 09:14:05 on 2025-04-01. Armed with the victim's Ghana Card photos and OTP, the fraudster (or a co-conspirator) attended Ananse Telecom outlet ANS-KSH-0042 in Kaneshie and completed a fraudulent SIM swap. The network registration log records the NETWORK_EVENT at 09:14:05; the Infinix Hot 30 was live on the victim's number 13 seconds later at 09:14:18. The victim lost cellular service from 09:13:42 (DEREGISTERED event). The customer notification SMS timestamped 09:22 is a CRM pipeline lag artefact and does not represent the execution time.

Stage 4 — Financial Extraction

Execution: 09:38 to 09:55 on 2025-04-01. The fraudster accessed the victim's AnansePay account using the hijacked SIM, changed security credentials, linked the Infinix Hot 30 device, and executed two transfers totaling GH¢ 4,350.00 to KWABENA MENSAH (account 0284281931) within four minutes. The entire account was drained in two transactions.

Stage 5 — Fund Laundering

Execution: Within 27 minutes of the second transfer (approximately by 10:09 on 2025-04-01). The full GH¢ 4,350.00 was onward-transferred from KWABENA MENSAH's account to ABDUL RAHMAN. This rapid layering through a secondary mule account was intended to place the funds beyond immediate recovery and to create transactional distance from the original crime.

F.3 Evidence Gaps — Additional Evidence Required

The following categories of evidence, not present on the examined device, would be necessary to identify and prosecute the perpetrator(s):

#	Evidence Category	Why Needed / Expected Source
1	Telecom CCTV Footage	The Ananse Telecom Kaneshie outlet is the physical location where the SIM swap was executed. CCTV footage from 09:00–09:40 on 2025-04-01 may capture the person who attended to complete the swap. Source: Ananse Telecom outlet.
2	SIM Swap Request Form / KYC Records	The outlet would have logged the identity documents and staff member who processed the swap. May reveal whether the Ghana Card photos were printed or displayed on a phone. Source: Ananse Telecom records.
3	KWABENA MENSAH Account Records	Full transaction history, linked phone number, SIM registration, KYC documents, and outgoing transfer records for account 0284281931. Source: AnansePay / Mobile Money Provider.
4	ABDUL RAHMAN Account Records	The second-tier mule account, same records as above. If funds were withdrawn in cash, ATM or agent transaction records and CCTV are critical. Source: AnansePay / Bank / Agent.
5	WhatsApp Sender Account Data	The WhatsApp account used to contact the victim. Subscriber details, device identifiers (IMEI), registration phone number, and IP logs.
6	IP Address & Session Logs	AnansePay login session logs at the time of the account takeover (09:38–09:55) would reveal the IP address used. Source: AnansePay backend servers.
7	Cell Tower Records	CDRs (Call Detail Records) from Ananse Telecom for the hijacked number during the active swap window. Would show location of the perpetrator's SIM at time of transactions. Source: Ananse Telecom network logs.
8	Infinix Hot 30 Forensic Image	The device linked to the victim's AnansePay at 09:55. If seized, it would contain the AnansePay session, transaction history, and potentially communications with co-conspirators. Source: Physical seizure.

F.4 Security Failure Analysis — Prevention Assessment

The following analysis maps each stage of the attack to the security control that could have prevented or mitigated it:

FRAUD STAGE	VICTIM ACTION / FAILURE	PREVENTIVE CONTROL
Social Engineering (08:20)	Engaged with unsolicited contact claiming to be telecom support without verification.	Never respond to unsolicited identity verification requests. Always call the official telecom customer service number to verify any support contact independently.
Ghana Card Disclosure (08:52–08:53)	Photographed and transmitted both sides of national ID document via a messaging app to an unverified contact.	National identity documents should never be transmitted digitally to any party via personal messaging apps. Legitimate telecom providers do not request Ghana Card photos via WhatsApp.
OTP Disclosure (09:14)	Shared a live OTP code received via SMS with a third party.	OTP codes are single-use security tokens that must never be shared with any person, including individuals claiming to represent service providers. This is explicitly warned against in all legitimate telecom and mobile money communications.
Account Takeover (09:14:05–09:38)	Took no immediate action during the 42-minute service outage.	Any unexplained loss of cellular service, especially following interaction with "support" contacts, should immediately trigger a call to the telecom provider from another phone, and a request to freeze the mobile money account.

Financial Extraction (09:38–09:42)	No account-level transaction limit or secondary approval was in place.	Enable transaction limits and require secondary authentication (e.g., PIN confirmation for transfers above a threshold) within the mobile money app. Register a secondary contact number for fraud alerts.
Fund Laundering (post-09:42)	Delayed reporting allowed funds to be layered before alert was raised.	Immediate reporting within minutes, not hours, to both the telecom provider and the mobile money provider is critical. Many providers can recall or freeze funds if notified before second-tier transfer completes.

SECTION G — FINDINGS & CONCLUSIONS

G.1 Summary of Key Findings

- The forensic image (E01) was verified as intact; MD5 hash 411b57cc86dca89d34eb5b89713788c3 confirmed.
- The fraud was executed over a 28-minute window (SIM swap at 09:14:05 to final transfer at 09:42), representing a highly efficient and pre-meditated operation. The customer notification SMS timestamped 09:22 is a CRM lag artefact and does not represent the SIM swap execution time.
- WhatsApp message metadata, SMS logs, device registration records, and the AnansePay database collectively provide a corroborated, unbroken chain of digital evidence linking each stage of the attack.
- Two primary mule accounts were identified: KWABENA MENSAH (0284281931) and ABDUL RAHMAN, both are necessary targets for further financial investigation.
- The Infinix Hot 30 device linked at 09:55 is a critical unrecovered exhibit.
- A co-conspirator at, or with access to, the Ananse Telecom Kaneshie outlet is strongly indicated given the physical SIM swap requirement.

G.2 Opinion

In the professional opinion of the examining forensic analyst, the digital evidence recovered from the Samsung Galaxy A23 (EX-001) is consistent with, and fully supports, the following conclusion:

The victim was subjected to a coordinated, pre-meditated SIM swap fraud on 2025-04-01, resulting in an unauthorized loss of GH¢ 4,350.00 from his AnansePay mobile money account. The perpetrator(s) employed social engineering via WhatsApp, obtained identity credentials, executed a physical SIM swap at a telecom retail outlet, and systematically drained and laundered the funds within a 50-minute window.

G.3 Examiner's Declaration

I declare that the contents of this report are true and accurate to the best of my knowledge and belief, that the examinations described herein were conducted in accordance with accepted digital forensics standards, and that I have impartially presented my findings.

—	2025-04-02	Police report filed by victim

Appendix C — Glossary

Term	Definition
SIM Swap	A process where a mobile number is fraudulently transferred to a new SIM card by impersonating the legitimate subscriber at a telecom outlet.
OTP	One-Time Password — a temporary, single-use security code used to verify identity in mobile banking and telecom transactions.
E01	Expert Witness Format — a forensic disk image format that stores data along with case information and hash verification.
MD5 Hash	A cryptographic function used to verify the integrity of a digital file; identical files produce identical hashes.
Mule Account	A bank or mobile money account used knowingly or unknowingly to receive and forward fraudulently obtained funds.

Logical Extraction	A forensic method that retrieves accessible file system data from a device without physical bit-for-bit imaging.
File System Extraction	A deeper extraction method that recovers file system structures and may include deleted data.
Layering	The second stage of money laundering, involving movement of funds through multiple accounts to obscure origin.
